Dear Mr. Rock:

I have been using DiesellIFT since the summer of 2002 and have had fantastic results using it.

We purchase our fuel at various pumps throughout the area we service because we do not have a main fueling tank. My employees blend it right at the pump with a mixture of 1 ounce per 5 gallons of fuel. They simply measure the amount in a measuring container, put the additive in and add the fuel. That is how simple it is to use it. It would be even easier to use if you had your own refueling tank.

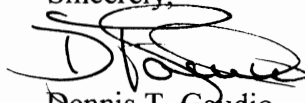

We have never experienced and equipment or performance problems using this additive. it is my understanding that this product also eliminates any water that is present in the fuel simply by burning it out with the fuel itself. The ratio of about 1:600 additive to fuel makes it very economical to use as diesel prices in Danville are currently \$3.64 a gallon.

When I did my tests 3 years ago we were paying \$1.60 so I estimate, with a 10% increase in fuel efficiency, that I am currently saving at least 30 cents a gallon in fuel costs.

If you are the least bit reluctant to try this product may I suggest using just one vehicle, document its mileage as accurately as possible (same driver, route and load weights) and do a before and after mileage test. If these tests are done accurately, I can promise you a significant and worthwhile savings in your fuel costs.

Please feel free to call me with any questions or concerns you may have concerning the use of this product.

Sincerely,

Dennis T. Gaudio
